

Problem I

Consider the following undirected graph. Each edge has a non-negative weight. The symbols x and y are variables that represent edge weights.

- (1) A simple path is a path such that no vertex (node) occurs twice in it. Enumerate all simple paths from A to F.
- (2) Suppose that the edge weights x and y are defined using a parameter t as follows:

$$x(t) = y(t) = t \quad (0 \leq t \leq 10).$$

- (a) Represent the length of the shortest path between A and C for $0 \leq t \leq 10$ as a function $L_1(t)$ with parameter t and show the corresponding shortest paths.
- (b) Represent the length of the shortest path between A and F for $0 \leq t \leq 10$ as a function $L_2(t)$ with parameter t and show the corresponding shortest paths.

Problem II

A perfect number is a positive integer that is equal to the sum of all its positive divisors, other than itself.

For example, 6 is a perfect number because $6 = 1 + 2 + 3$.

- (1) Write the function `void divisor(int n)`, which displays all of the positive divisors of a positive integer n .
- (2) The function `int is_perfect(int n)` returns 1 if a positive integer n is a perfect number, and returns 0 otherwise. Complete the following definition of the function `is_perfect` by filling the box (a).

```
int is_perfect(int n)
{
    int i, sum;

    if (n <= 0)
        return 0;

    sum = 0;
    for (i = 1; i < n; i++) {
        (a)
    }

    if (sum == n)
        return 1;
    else
        return 0;
}
```

- (3) The following C program displays all perfect numbers less than or equal to 1000.

Finally, the elements of the array `sum` are as follows:

Index i	1	2	3	4	5	6	...
<code>sum[i]</code>	0	1	1	3	1	6	...

Complete the program by filling the boxes (b) and (c).

基礎課題 (数学と情報基礎の全ての問題に解答すること)

じょうほう きそ
情報基礎

以下の問題I、問題IIを解答せよ。各解答は別々の答案用紙に記入すること。

Solve both Problem I and Problem II, answering in two different sheets for them.

(Continues from the previous page)

```
#include <stdio.h>

#define N 1000

int main(void)
{
    int i, j, sum[N + 1];

    for (i = 1; i <= N; i++)
        sum[i] = 0;

    for (j = 1; j <= N / 2; j++) {
        for ( (b) ) {
            (c)
        }
    }

    for (i = 1; i <= N; i++) {
        if (sum[i] == i)
            printf("%d\n", i);
    }

    return 0;
}
```
